

A clear introduction to the mission, the predicted savings and the path from one site to industry.

Scale by adding local hubs and edge devices; keep raw telemetry local when policy allows.

Mission

Aura makes energy visible, shifts flexible loads into better tariff windows and gives the owner a readable reason for every decision. The modelled target is **18%–32% lower avoidable energy cost** in suitable scenarios. This is a prediction target, not a field guarantee.

Designed to scale

The same local hub pattern can be repeated across homes, workshops, buildings, zones and production lines. A supervisory layer can combine approved summaries while each local hub keeps operating at the edge.

Your data can stay inside

When deployed on a private network without a cloud relay, measurements and control traffic can remain inside the premises. The actual boundary depends on firewall rules, software configuration, remote

access and integrations.
